About Indoor Solar Panels

Want to extend the battery life of your indoor devices and appliances? Want to reduce battery replacement and system maintenance costs?

PowerFilm designs, manufactures and assembles custom indoor solar solutions ranging from microwatts to milliwatts.

Our IoT solutions feature amorphous silicon solar material optimized for use in indoor environments operating down to 200 lux and below.

Amorphous is inherently more sensitive than traditional solar technologies in low light settings, whether that's indoors or simply non-ideal outdoor environments.

We've been providing customer-driven solutions for over 30 years including custom solar panels, encapsulation and complete solution designs.

Contact us with your requirements and we will create the best solution for your power needs.
